Public Cloud

ANALYST DAY. 

## Consider this...

- 1 Public Cloud (AWS, Azure & GCP)
- 2 Cloud native technology adopters
- 3 Customers that don't have a SOC

# The way things were

# Security approaches are evolving

Traditional solutions are not enough in a cloud environment

The hyperscalers constantly expand their native security products

Rackspace Technology is well positioned to help customers navigate

Not everything runs on a server

Not everything can be secured with a firewall

Agents require rearchitecting and redeploying the environment

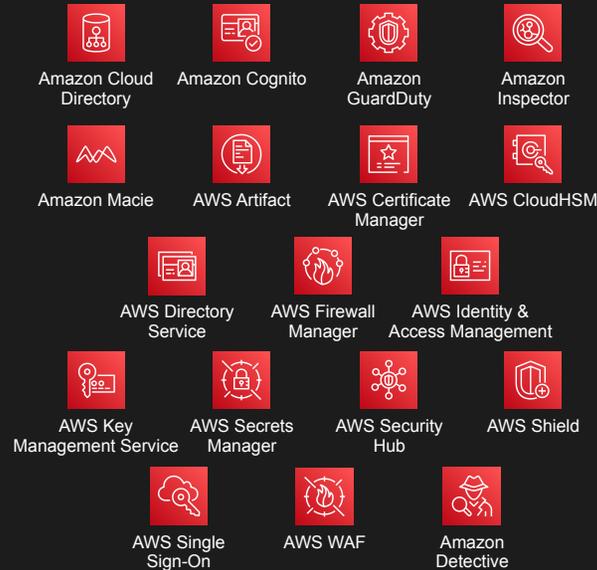

Appliances don't scale

Security vendors are not always truly cloud native

**Example:** AWS has 18 security services

**Advantages: inexpensive, well-integrated, and easy to enable**

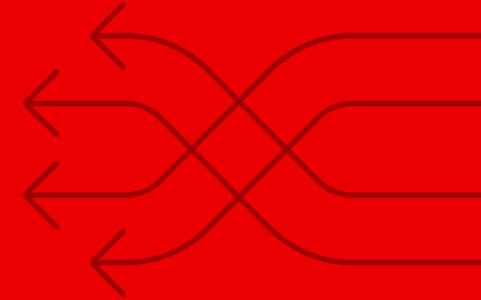

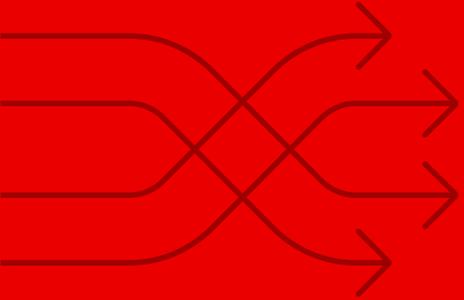

Enabling the products is not enough – somebody needs to **monitor and respond**

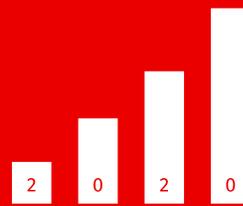

To be effective, it requires expertise and investment in a **24x7x365 SOC**
